The manner of calculating the check digit of the sort code

1. The check digit is the result of mathematical transformation of the preceding digits in the number with the modulo 10 method, i.e. the method of linking an organisational unit number with the system of check digits, consisting in the application of positional multipliers (weights) in a repeated sequence 3, 9, 7, 1 while dividing by (modulo) 10 for the remainder 0, according to the formula:

$$K = \left(10 - \left(\sum_{i=1}^7 x_i y_i \right) \bmod 10 \right) \bmod 10$$

2. The distribution of weights shall be as follows:

Sort code:

Item (<i>i</i>)	1	2	3	4	5	6	7	8
Digit (<i>x</i>)	W	W	W	W/J	J	J	J	K
Weight (<i>y</i>)	3	9	7	1	3	9	7	1

W – digit of the code identifying the bank (identifier)

J – digit of the sequential number

K – check digit

3. Verification of the correctness of the check digit is done by the application of the formula:

$$\left(\sum_{i=1}^8 x_i y_i \right) \bmod 10 = 0$$
